| PV | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ |

- The total number of timers is 256 (T0~T255) with three different time bases, 0.01S, 0.1S and 1S. The default number and allocation of timers is shown as below (Can be adjusted according to user's actual requirements by the "Configuration" function):
 - T0~T49 : 0.01S timer (default as 0.00~327.67S) ◦
 - T50~T199 : 0.1S timer (default as 0.0~3276.7S) ◦
 - T200~T255 : 1S timer (default as 0~32767S) ◦
- FB-PLC programming tool will lookup the timer's time base automatically according to the "Memory Configuration" after the timer number is keyed in. Timer's time = Time base x Preset value. In the example 1 below, the time base T0 = 0.01S and the PV value = 1000, therefore the T0 timer's time = 0.01S x 1000 = 10.00S.
- If PV is a register, then Timer's time = Time base x register content. Therefore, you only need to change the register content to change the timer's time. Please refer to Example 2.
- ※ The maximum error of a timer is a time base plus a scan time. In order to reduce the timing error in the application, please use the timer with a smaller time base.

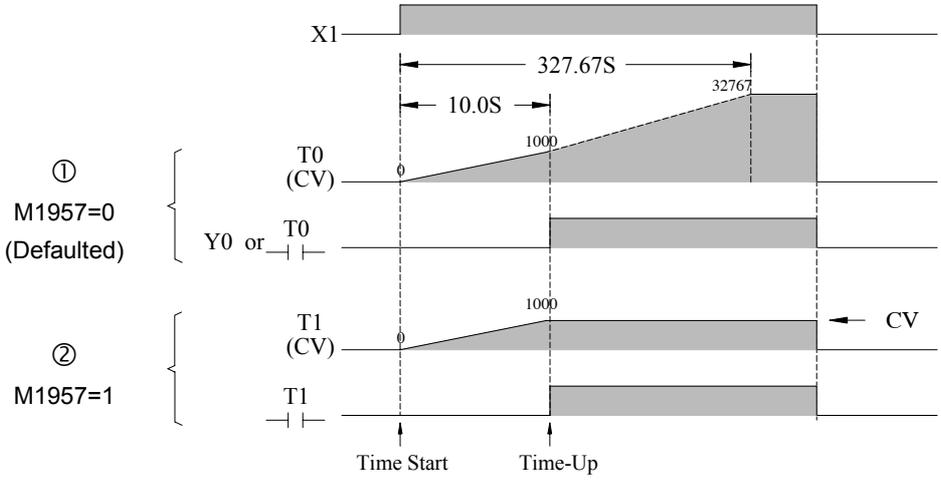

| | |
|-------------|--|
| Description | |
|-------------|--|

- When the time control "EN" is 1, the timer will start timing (the current value will accumulate from 0) until "Time Up" (i.e. CV ≥ PV), then the Tn contact and TUP (FO0) will change to 1. As long as the timer control "EN" input is kept as 1, even the CV of Tn has reached or exceeded the PV, the CV of the timer will continue accumulating (with M1957 = 0) until it reaches the maximum limit (32767). The Tn contact status and flag will remain as 1 when CV ≥ PV, unless the "EN" input is 0. When "EN" input is 0, the CV of Tn will be reset to 0 immediately and the Tn contact and "Time Up" flag TUP will also change to 0 (please refer to the diagram ① below).
- If the FB_E/FB_N-PLC OS version is higher than V3.0 (inclusive), the M1957 can be set to 1 so the CV will not accumulate further after "Time Up" and stops at the PV value. The default value of the M1957 is 0, therefore the status of M1957 can be set before executing any timer instruction in the program to individually set the timer CV to continue accumulating or stop at the PV after "Time Up" (please refer to the diagram ② below).

| | | |
|---|-------|---|
| T | TIMER | T |
|---|-------|---|

| | |
|-----------|-----------------------|
| Example 1 | Constant preset value |
|-----------|-----------------------|

| Ladder diagram | Key operations | Mnemonic code |
|---|----------------|---|
| <p>An example of taking "Time-Up" signal directly from FO0.</p> | | <pre> ORG X 1 T0 PV: 1000 FO 0 OUT Y 0 ORG SHORT SET M 1957 ORG X 1 T1 PV: 1000 </pre> |

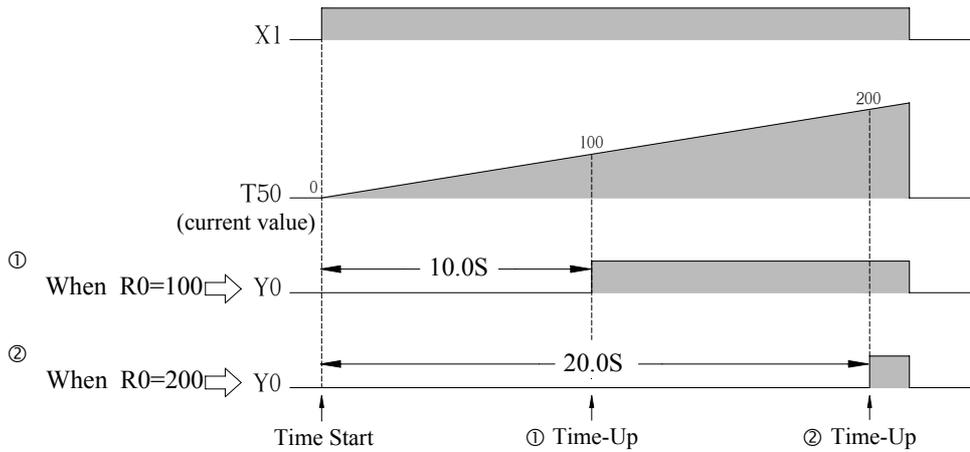

| | |
|-----------|-------------|
| Example 2 | Variable PV |
|-----------|-------------|

The preset value (PV) shown in example 1 is a constant which is equal to 1000. This value is fixed and can not be changed once programmed. In many circumstances, the preset time of the timers needs to be varied while PLC running. In order to change the preset time of a timer, can first use a register as the PV operand (R or WX, WY...), and then the preset time can be varied by changing the register content. As shown in this example, if set R0 to 100, then T becomes a 10S Timer, and hence if set R0 to 200, then T becomes a 20S Timer.

Basic Function Instruction

| | | |
|---|-------|---|
| T | TIMER | T |
|---|-------|---|

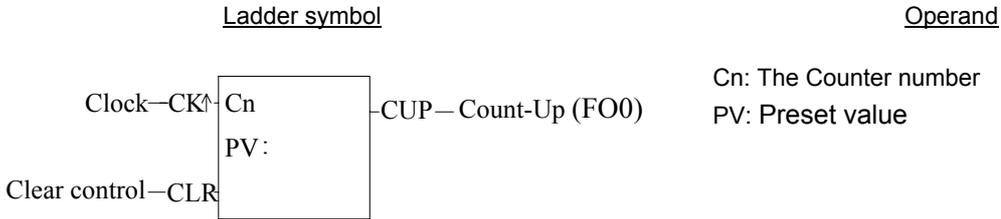

| Ladder diagram | Key operations | Mnemonic code |
|--|----------------|---|
| <p style="text-align: center;">An example of applying the "time-up" status by using the T50 contact.</p> | | <pre> ORG X 1 T 50 [PV:] R 0 ORG T 50 OUT Y 0 </pre> |

Remark: If the preset value of the timer is equal to 0, then the timer's contact status and FO0 (TUP) become 1 ("EN" input must be at 1) immediately after the PLC finishes its first scan because "Time-Up" has occurred. (TUP) stays at 1 until "EN" input changes to 0.

| | | |

| Cn | | | | | | ○ | | | | | | | |
| PV | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ |

- There are total 200 16-Bit counters (C0~C199). The range of preset value is between 0~32767. C0~C139 are Retentive Counters and the CV value will be retained when the PLC turns on or RUN again after a power failure or a PLC STOP. For Non Retentive Counters, if a power failure or PLC STOP occurs, the CV value will be reset to 0 when the PLC turns on or RUN again.
- There are total 56 32-Bit counters (C200~C255). The range of the preset value is between 0~2147483647. C200~C239 are Retentive Counters and C240~C255 are Non Retentive Counters.
- The default number and assignment of the counters are shown below, if necessary can use the "CONFIGURATION" function to change the settings.
- To insure the proper counting, the sustain time of input status of CLK should greater than 1 scan time.
- The max. counting frequency with this instruction can only up to 20Hz, for higher frequency please use the high-speed soft/hardware counter.

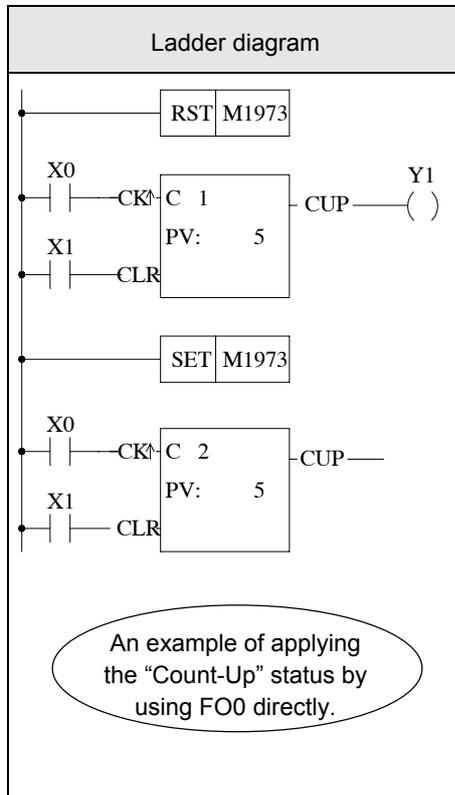

| | |
|-------------|--|
| Description | |
|-------------|--|

- When "CLR" is at 1, all of the contact Cn, FO0 (CUP), and CV value of the counter CV are cleared to 0 and the counter stops counting.
- When "CLR" is at 0, the counter is allowed to count up. The Counter counts up every time the clock "CK ↑" changes from 0 to 1 (adds 1 to the CV) until the cumulative current value is equal to or greater than the preset value (CV>=PV), the counter "Count-Up" and the contact status of the counter Cn and FO0 (CUP) changes to 1. If the input status of clock continues to change, even the cumulative current value is equal and greater than the preset value, the CV value will still accumulate until it reaches the up limit at 32767 or 2147483647. The contact Cn and FO0 (CUP) stay at 1 as long as CV>=PV unless the "CLR" input is set to 1. (please refer the diagram ① below) ◦
- If the FB_E/FB_N-PLC OS version is higher than V3.0 (inclusive), the M1973 can set to 1 so the CV will not accumulate further after "Count Up" and stops at the PV. M1973 default value is 0, therefore the status of M1973 can be set before executing any counter instruction in the program to individually set the counter CV to continue accumulating or stops at the PV after "Count Up" (please refer to the diagram ② below).

An example of applying the "Count-Up" status by using FO0 directly.

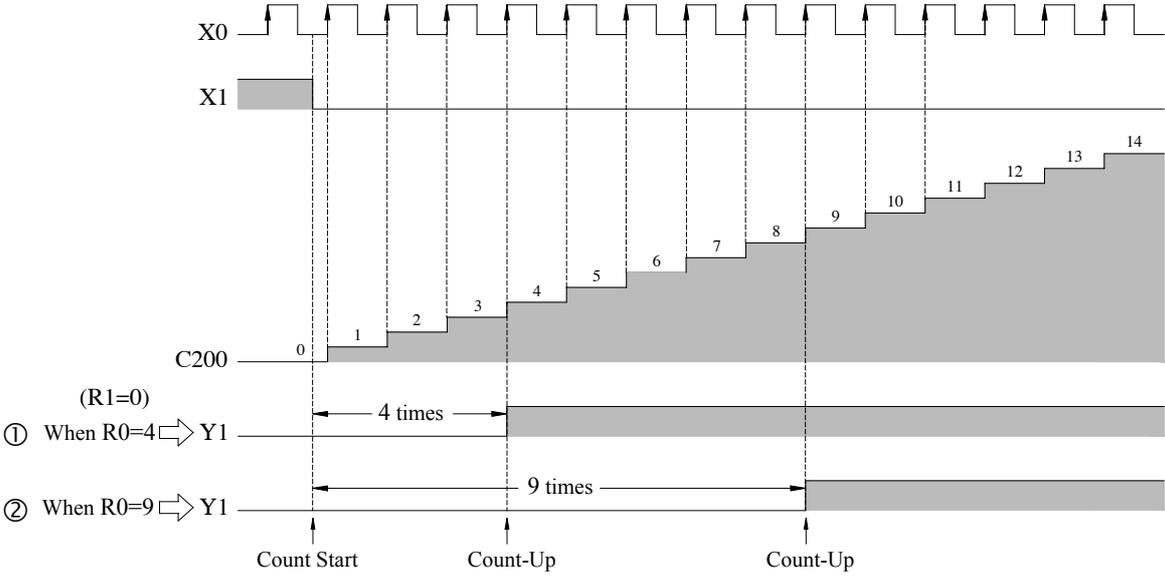

| | |
|------------------|---|
| Example 2 | 32-Bit counter with variable preset value |
|------------------|---|

Like a timer, if the PV of a counter is changed to a register (such as R, D, and so on), the counter will use the register contents as the counting PV. Therefore, only need to change the register contents to change the PV of the counter while PLC is running. Below is an example of a 32-bit counter that uses the data register R0 as the PV (in fact it is the 32-bit PV formed by R1 and R0).

| | | |
|---|--|---|
| C | COUNTER (16-Bit: C0~C199, 32-Bit: C200~C255) | C |
|---|--|---|

|-------------|--------------------------|-------------|
| FUN 0 MC | MATER CONTROL LOOP START | FUN 0 MC |
|-------------|--------------------------|-------------|

Remark1:MC/MCE instructions can be used in nesting or interleaving as shown to the right:

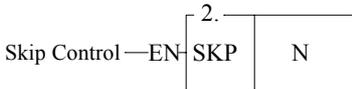

- Remark2:
- When M1918=0 and the master input changes from 0→1, and if pulse type function instructions exist in the master control loop, then these instructions will have a chance to be executed only once (when the first time the master control input changes from 0→1). Afterwards, no matter how many times the master control input changes from 0→1, the pulse type function instructions will not be executed again.
 - When M1918=1 and the master control input changes from 0→1, and if pulse type function instructions exist in the master control loop, then each time the master control input changes from 0→1 the pulse type function instructions in the master control loop will be executed as long as the action conditions are satisfied.
 - When a counting instruction exists in the master control loop, set M1918 to 0 can avoid counting error.
 - When the pulse type function instructions in the master control loop must act upon the 0→1 input change by the master control, the flag M1918 should be set to 1.

Basic Function Instruction

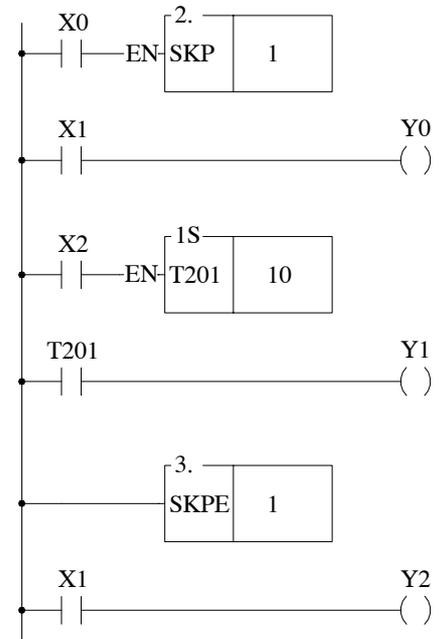

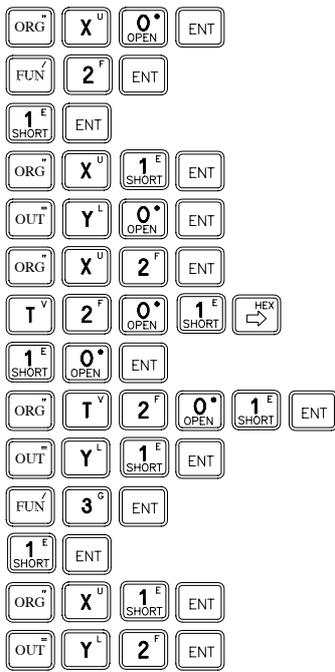

| FUN 1 MCE | MASTER CONTROL LOOP END | FUN 1 MCE |

Description

- When the status of clear control "CLR" is at 1, then the data of register D and FO0 will all be cleared to 0. Other input signals are all in effect.
- When the status of clear control is "CLR" at 0, then the shift operation is permissible. When the shift control "EN" = 1 or "EN ↑" (**DP** instruction) from 0 to 1, the data of the register will be shifted to right (L/R=0) or to left (L/R=1) by one bit. The shifted-out bit (MSB when shift to left and LSB when shift to right) for both cases will be sent to FO0. The vacated bit space (LSB when shift to left and MSB when shift to right) due to shift operation will be filled in by the input status of fill-in bit "INB".

Example Shifts the 16-bit register data

Description

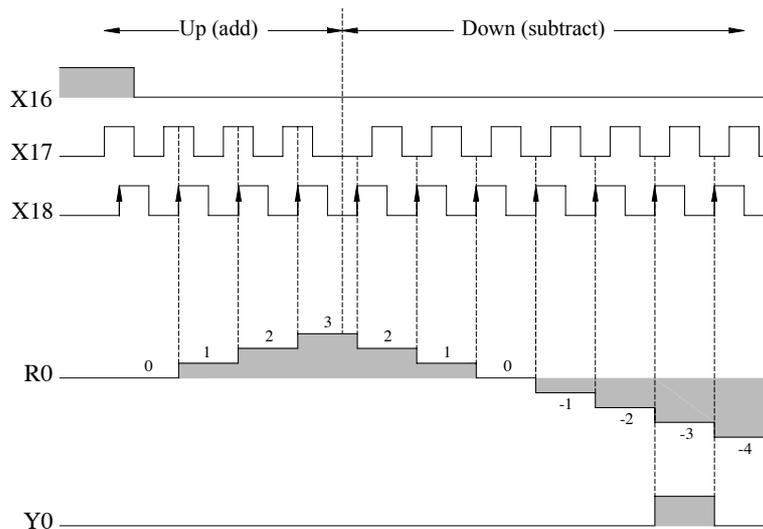

- When the clear control “CLR” is 1, the counter’s CV will be reset to 0 and the counter will not be able to count.
- When the clear control “CLR” is 0, counting will then be allowed. The nature of the instruction is a P instruction. Therefore, when the clock “CK ↑” is 0→1 (rising edge), the CV will increased by 1 (if U/D=1) or decreased by 1 (if U/D=0).
- When CV=PV, FO0(“Count-Up”) will change to 1”. If there are more clocks input, the counter will continue counting which cause CV≠PV. Then, FO0 will immediately change to 0. This means the “Count-Up” signal will only be equal to 1 if CV=PV, or else it will be equal to 0 (Care should be taken to this difference from the “Count-Up” signal of the general counter).
- The upper limit of up count value is 32767 (16-bit) or 2147483647 (32-bit). After the upper limit is reached, if another up count clock is received, the counting value will become -32768 or -2147483648 (the lower limit of down count).
- The lower limit of down count value is -32767 (16-bit) or -2147483647 (32-bit). After the lower limit is reached, if another down count clock is received, the counting value will become 32768 or 2147483648 (the upper limit of up count).
- If U/D is fixed as 1, the instruction will become a single-phase up count counter. If U/D is fixed as 0, the instruction will become a single-phase down count counter.

Remark 1: Since the counting operation of UDCTR is implemented by software scanning, therefore if the clock speed is faster than the scan speed, lose count may then happen (generally the clock should not exceed 20Hz depending on the size of the program). Please use the software or hardware high-speed counter in the PLC. Refer to the “High Speed Counter Application” in the Advanced Manual.

Remark 2: In order to ensure the proper counting, the sustain time of the status of clock input should greater than 1 scan time.

| S | <input type="checkbox"/> |
| D | <input type="checkbox"/> |

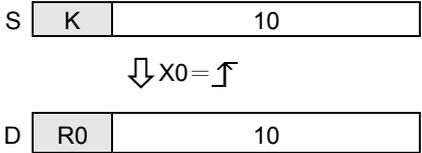

Description

- Moves (writes) the data of S to a specified register D when the move control input "EN" =1 or "EN↑" (**P** instruction) from 0 to 1.

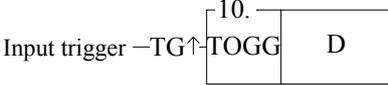

Example

Writes a constant data into a 16-bit register.

Description

- Performs the addition of the data specified at Sa and Sb and writes the results to a specified register D when the add control input "EN" = 1 or "EN ↑" (P instruction) from 0 to 1. If the result of addition is equal to 0 then set FO0 to 1. If carry occurs (the result exceeds 32767 or 2147483647) then set FO1 to 1. If borrow occurs (adding negative numbers resulting in a sum less than -32768 or -2147483648), then set the FO2 to 1. All the FO statuses are retained until this instruction is executed again and overwritten by a new result.

Example 16-bit addition

| Ladder Diagram | Key Operations | Mnemonic Codes |
|---|----------------------------|--|
| | | ORG X 0 FUN 11P Sa : R 0 Sb : R 1 D : R 2 FO 1 OUT Y 0 |

Description

- Performs the division of the data specified at Sa and Sb and writes the quotient and remainder to registers specified by register D when the division control input "EN" = 1 or "EN ↑" (DP instruction) from 0 to 1. If the quotient of division is equal to 0 then set FO0 to 1. If the divisor Sb=0 then set the error flag FO1 to 1 without executing the instruction.

Example 1 16-bit division

| Ladder Diagram | Key Operations | Mnemonic Codes | | | | | | | | | | | | | | | |
|----------------|----------------|--|-----|---|---|-----|----|--|------|---|---|------|---|---|-----|---|---|

Basic Function Instruction

| | | |
|--------------------------|---|--------------------------|
| FUN 15 DP (+1) | INCREMENT (Adds 1 to the D value) | FUN 15 DP (+1) |
|--------------------------|---|--------------------------|

Ladder symbol

Operand

D : The register to be increased
 D may combine with V, Z to serve indirect addressing

| Range | WY | WM | WS | TMR | CTR | HR | OR | HR | HSCR | RTCR | SR | ROR | DR |
|--------------|-------------------|--------------------|-------------------|-----------------|-----------------|------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|------------------|
| Ope- rand | WY0 WY240 | WM0 WM1896 | WS0 WS984 | T0 T255 | C0 C255 | R0 R3839 | R3904 R3919 | R3920 R4047 | R4096 R4127 | R4128 R4135 | R4136 R4167 | R5000 R8071 | D0 D3071 |
| D | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○* | ○* | ○ |

- Adds 1 to the register D when the increment control input "EN" =1 or "EN ↑" (**P** instruction) from 0 to 1. If the value of D is already at the upper limit of positive number 32767 or 2147483647, adding one to this value will change it to the lower limit of negative number -32768 or -2147483648. At the same time, the overflow flag FO0 (OVF) is set to 1.

Example

16-bit increment register

| Ladder diagram | Key operations | Mnemonic code |
|----------------|----------------|---|
| | | <pre> ORG TU X 0 FUN 15 [D] R 0V </pre> |

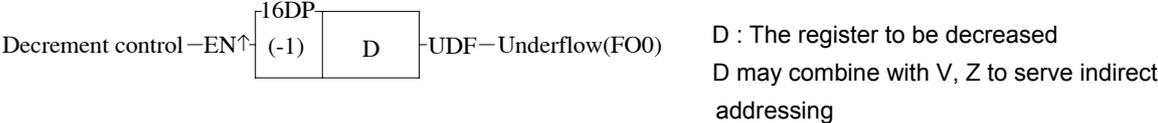

When V = 100 · 0 + 100 = 100

| | | |
|-----------------------------|--|-----------------------------|
| FUN 16 DP (- 1) | DECREMENT (Subtracts 1 from the D value) | FUN 16 DP (- 1) |
|-----------------------------|--|-----------------------------|

Ladder symbol

Operand

| Range | WY | WM | WS | TMR | CTR | HR | OR | HR | HSCR | RTCR | SR | ROR | DR |
|---------|-----------|------------|-----------|----------|----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| Operand | WY0 | WM0 | WS0 | T0 | C0 | R0 | R3904 | R3920 | R4096 | R4128 | R4136 | R5000 | D0 |
| | WY240 | WM1896 | WS984 | T255 | C255 | R3839 | R3919 | R4047 | R4127 | R4135 | R4167 | R8071 | D3071 |
| D | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○* | ○* | ○ |

Description

- Subtracts 1 from the register D when the decrement control input "EN" =1 or "EN ↑" (P instruction) from 0 to 1. If the value of D is already at the lower limit of negative number -32768 or -2147483648, subtracting one from this value will change it to the upper limit of positive number 32767 or 2147483647. At the same time, the underflow flag FO0 (UDF) is set to 1.

Example

16-bit decrement register

| Ladder diagram | Key operations | Mnemonic code |
|----------------|----------------|---|
| | | ORG X 0 FUN 16P [D] : R 0 |

↓ X0 = 1

Basic Function Instruction

| | | |
|--------------------------------|--|--------------------------------|
| FUN 17 DP CMP | COMPARE (Compares the data of Sa and Sb and outputs the results to function Outputs) | FUN 17 DP CMP |
|--------------------------------|--|--------------------------------|

| | | |
|----------------------|--|---|
| | <u>Ladder symbol</u> | <u>Operand</u> |
| Compare control -EN↑ | 17DP.CMP Sa: a=b – Sa=Sb(FO0) Sb: a>b – Sa=Sb(FO0) a<b – Sa=Sb(FO0) | Sa: The register to be compared Sb: The register to be compared Sa, Sb may combine with V, Z to serve indirect addressing |

| Range | WX | WY | WM | WS | TMR | CTR | HR | IR | OR | HR | HSCR | RTCR | SR | ROR | DR | K |
|---------|-------|-------|--------|-------|------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|------------------------|
| Operand | WX0 | WY0 | WM0 | WS0 | T0 | C0 | R0 | R3804 | R3904 | R3920 | R4096 | R4128 | R4136 | R5000 | D0 | 16/32 bit +/-number |
| | WX240 | WY240 | WM1896 | WS984 | T255 | C255 | R3839 | R3903 | R3919 | R4047 | R4127 | R4135 | R4167 | R8071 | D3071 | |
| Sa | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ |
| Sb | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ |

- Compares the data of Sa and Sb when the compare control input "EN" =1 or "EN ↑" (P instruction) from 0 to 1. If the data of Sa is equal to Sb, then set FO0 to 1. If the data of Sa>Sb, then set FO1 to 1. If the data of Sa<Sb, then set the FO2 to 1. If the data of Sa < Sb, then set the FO2 to 1.

Example Compares the data of 16-bit register

| Ladder diagram | Key operations | Mnemonic code |
|----------------|----------------|--|
| | | ORG X 0 FUN 17 [Sa] : R 0 [Sb] : R 1 FO 2 OUT Y 0 |

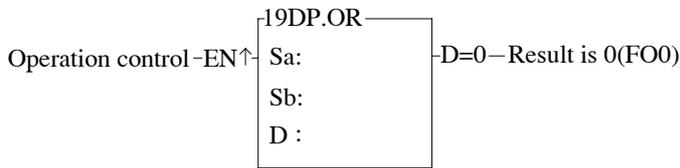

- From the above example, we first assume the data of R0 is 1 and R1 is 2, and then compare the data by executing the CMP instruction. The FO0 and FO1 are set to 0 and FO2 (a<b) is set to 1 since a<b.
- If you want to have the compound results, such as \geq , \leq , \cdot , $>$ etc., please send = , \cdot and $>$ results to relay first and then combine the result from the relays.
- M1919=0, when this command in not executed, FO0, FO1, FO2 will remain in the status at last execution.
- M1919=1, when this command in not executed, FO0, FO1, FO2 are all cleared to 0.
- Control M1919 properly to obtain memory-holding function for functional command output.

Basic Function Instruction

| | | |
|-------------------------|------------|-------------------------|
| FUN 19 D P OR | LOGICAL OR | FUN 19 D P OR |
|-------------------------|------------|-------------------------|

Ladder symbol

Operand

Sa: The register to be ORed
 Sb: The register to be ORed
 D : The register to store the result of OR
 The Sa, Sb, D may combine with V, Z to serve indirect addressing

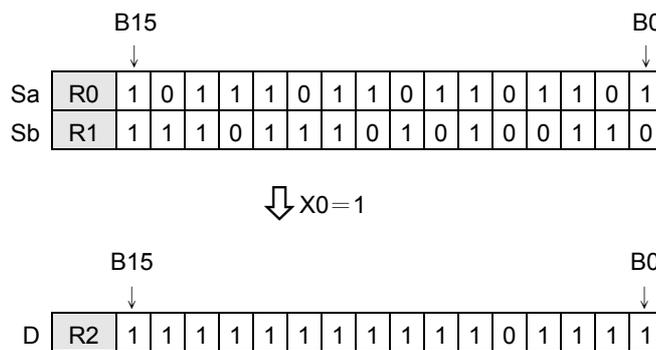

| Range | WX | WY | WM | WS | TMR | CTR | HR | IR | OR | HR | HSCR | RTCR | SR | ROR | DR | K |
|---------------|-------|-------|--------|-------|------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|------------------------|
| Oper- rand | WX0 | WY0 | WM0 | WS0 | T0 | C0 | R0 | R3804 | R3904 | R3920 | R4096 | R4128 | R4136 | R5000 | D0 | 16/32 bit +/-number |
| | WX240 | WY240 | WM1896 | WS984 | T255 | C255 | R3839 | R3903 | R3919 | R4047 | R4127 | R4135 | R4167 | R8071 | D3071 | |
| Sa | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | | ○ | ○ | ○ | ○ | ○ | ○ |
| Sb | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | | ○ | ○ | ○ | ○ | ○ | ○ |
| D | | ○ | ○ | ○ | ○ | ○ | ○ | | ○ | | ○ | ○ | ○* | ○* | ○ | |

- Performs logical OR operation for the data of Sa and Sb when the operation control input "EN" =1 or "EN ↑" (**P** instruction) from 0 to 1. This operation compares the corresponding bits of Sa and Sb (B0~B15 or B0~B31). The bit in the D is set to 1 if one of the corresponding of Sa or Sb is 1. The bit in the D is set to 0 if both of the corresponding bits of Sa and Sb is 0.

Example

Operation of 16-bit logical OR

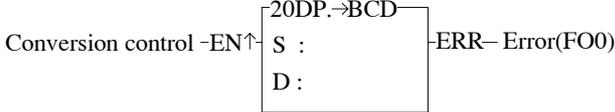

| Ladder diagram | Key operations | Mnemonic code |
|----------------|----------------|---|
| | | <pre> ORG X 0 FUN 19 [Sa]: R 0 [Sb]: R 1 [D]: R 2 </pre> |

| | | |
|---|--|---|
| FUN 20 D P →BCD | BIN TO BCD CONVERSION (Converts BIN data of the device specified at S into BCD and stores the result in D) | FUN 20 D P →BCD |
|---|--|---|

Ladder symbol

Operand

S : The register to be converted
 D : The register to store the converted data (BCD code)
 The S, D may combine with V, Z to serve indirect addressing

| Range | WX | WY | WM | WS | TMR | CTR | HR | IR | OR | HR | HSCR | RTCR | SR | ROR | DR | K |
|---------|-------|-------|--------|-------|------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|------------|
| Operand | WX0 | WY0 | WM0 | WS0 | T0 | C0 | R0 | R3804 | R3940 | R3920 | R4096 | R4128 | R4136 | R5000 | D0 | 16/32 bit |
| | WX240 | WY240 | WM1896 | WS984 | T255 | C255 | R3839 | R3903 | R3919 | R4047 | R4127 | R4135 | R4167 | R8071 | D3071 | +/- number |
| S | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ | ○ |
| D | | ○ | ○ | ○ | ○ | ○ | ○ | | ○ | ○ | ○ | ○ | ○* | ○* | ○ | |

- FB-PLC uses binary code to store and to execute calculations. If want to send the internal PLC data to the external displays such as seven-segment displays, it is more convenient for us to read the result on screen by converting the BIN data to BCD data. For example, it is more clear for us to read the reading "12" instead of the binary code "1100."
- Converts BIN data of the device specified at S into BCD and writes the result in D when the operation control input "EN" =1 or "EN ↑" (D instruction) from 0 to 1. If the data in S is not a BCD value (0~9999 or 0~9999999), then the error flag FO0 is set to 1 and the old data of D are retained.

Example 16-bit BIN to BCD conversion

| Ladder diagram | Key operations | Mnemonic code |
|----------------|----------------|---|
| | | ORG X 0 FUN 20 S : 9999 D : R 0 |
